

# ANGEL Learning Video Integration Tips

---

If you are using ANGEL Learning as your Learning Management System, here are some specific tips to help you integrate both Title/Segment URLs and an Embedded Player.

- When embedding videos, add the video as Course Content by creating a new Page and pasting the code using the "Source" icon in the editor.
- In Internet Explorer 8 there is a setting that displays the security warning when a page has mixed content. Most institutions host ANGEL securely (https://) and that content (e.g., FMG video) that is hosted externally may not be within a secure site (http://), so IE 8 by default wants to prompt the user when there is a mix of secure and non-secure content. Here are some options:
  - 1. The security prompt is confusing and most users simply click on "Yes." That blocks On Demand from showing. Clicking "No" on the security warning will allow On Demand to load correctly.
    2. Use Firefox or another browser that does not limit this by default.
    3. Show users how they can change their IE security settings. To do this:
    4.
      1. Click on Internet Explorer.
      2. Select Tools.
      3. Select Internet Options.
      4. Select the Security tab.
      5. Click the Custom Level button.
      6. Scroll about halfway down and disable for "Display mixed content."

## Learning Management System Integration Tips

---

There are two ways to integrate videos from On Demand into any online Learning Management System. Users can either use the Title/Segment URL or the Embed Code provided for every video in their collection. Using a Title/Segment URL will provide a perpetual link to a specific video or segment. Using the Embed Code will allow users to embed a full-featured Flash Video player directly into any HTML page.

### **Title/Segment URL - General Tips**

- When linking to individual titles, please be sure to use the Title URL or Segment URL located on the View Video page below the video player for a video (examples below), and NOT the URL displayed in your web browser's address bar.

#### Title URL

<http://digital.films.com/PortalPlaylists.aspx?aid=43461&xtid=475111>

#### Segment URL

<http://digital.films.com/PortalPlaylists.aspx?aid=43461&xtid=475111>

- When importing a Title or Segment URL into your Learning Management System, try copying the link as plain text as opposed to setting it as a web link.
- Make sure when copying the Title/Segment URL that you do not copy any additional spaces at the end of the URL. Some Learning Management Systems, such as Blackboard, can be rigid in how they accept URLs and that extra space could cause an issue.
- Be wary that sometimes the "&" in a URL can get displaced when clicking through different text / HTML formats.
- For additional help, please contact your Learning Management System Technical Support as well.

## Embed Code - General Tips

- Make sure you are highlighting the full embed code (example below) when you copy it. To verify this, be sure that the code begins with `<div id=emb0000>` and ends with `</script>`.

#### Embed Code (Full Title)

```
<div id=" " "></div><script type="text/javascript">function addLoadEvent(func) {var oldonload = window.onload;if (typeof window.onload != 'function') {window.onload = func} else {window.onload = function() {if (oldonload) {oldonload()}func()}}}</script><script type="text/javascript">addLoadEvent(function T47633(){document.getElementById( " ").innerHTML = "<iframe height='310' frameborder='0' width='348' src='http://digital.films.com/OnDemandEmbed.aspx?Token= &aid= &Pit=F0D&loid=0&vw=320&h=240&ref=' + window.location.href + "'>&nbsp;</iframe>"});</script>
```

- This embed code is intended to be pasted into an HTML source. It will not work with Word, Excel, PowerPoint, or most plain text email.
- As a rule, when embedding using a web/blog editor, always look for the "source code" option. In most cases, inputting the code as plain text will not work.
- To offer the highest level of flexibility to our customers, we offer two embed code options: standard and alternate. The default method of authentication for either type of embed code is username/password. If you'd like to use a different method of authentication, you will want to use the type of embed code that is most compatible with your selected authentication method. The standard embed code is compatible with the referring URL method of authentication. The alternate embed code provides the option of using proxy authentication.
